DESTEC REGENERATOR & REACTOR VESSEL HEAD REMOVAL DRY CUTTING, MACHINED FROM THE OUTSIDE

CUTTING OPERATION TAKES ONLY 24HRS

SIZE RANGES FROM 2 METRE DIAMETER THROUGH TO 20 METRES AND BEYOND

AVAILABLE WORLDWIDE... REGENERATOR & REACTOR VESSEL HEAD REMOVAL / REPLACEMENT FROM THE INDUSTRY LEADER
The Task

Regenerator & Vessel Head turnarounds are the most critical of operations in the refinery life cycle and numerous factors need to be carefully considered during project planning, such as:

- Site safety
- Scope of work
- Cutting methods to be employed and machine tools required
- Established capabilities of contracting team
- Mobility of contracting team
- Quality assurance provided by contractor
- Estimated turnaround time
- Predicted weather conditions
- Possible disruption to other processes
- Logistics
- Costs

Bringing all these factors satisfactorily together for a smooth, speedy and ‘event-free’ turnaround, particularly in remote or inhospitable areas of the world, can be a major concern for refinery operators.

The Solution

Dry Cutting Operations by Oil & Gas solutions provider, Destec Engineering, offer a range of advantages for the turnaround of even the largest FCCU Regenerator & Reactor Vessel Head:

- Fast, efficient dry cutting process
- Cutting can start even before plant is shut down
- The actual cutting operation takes 24 – 36 hours
- Weld preps can be machined on one or both sides of the cut line (depending on whether the same head is to be reused)
- Cutting of Overhead lines also available by Destec
- In House designed machines attached externally to the vessel via purpose made tracks. Steel is cut using milling heads followed by diamond cutting of the refractory.
- Clean – little or no post operative cleaning (unlike waterjet cutting that can take up to 10 days to ‘mop-up’)
- Non-polluting and environmentally friendly
- Over 10 years’ experience in Regenerator Head & Vessel removal. Largest project to date: 17m diameter with 125mm refractory wall thickness
- Highly skilled team
- Portable equipment – team has ability to work worldwide
- Total project planning and execution

The Company

Formed in 1969, Destec Engineering Ltd is a specialist engineering company for the Oil & Gas Industry. Based in Washingborough, Lincolnshire, UK, Destec operates on a global scale; designing and manufacturing a highly-acclaimed range of Oil & Gas industry approved products and offering a comprehensive range of on-site services.

The product range includes G Range Clamp Connectors, ROV operable GSB Single Bolt Clamp Connectors, Type Approved Compact Flanges, Seal Rings and Boiler Inspection Caps.

Complementing its Regenerator & Vessel Head turnaround operations, Destec on-site services cover Machining, Special Purpose Machine Tools, On-line Leak Sealing, Bolt Tensioning, Polymer Coatings & Repair and Ultrasonic Testing.

FCCU (Fluid Catalytic Cracking Unit)

A Fluid Catalytic Cracking Unit has been an integral part of oil refineries since 1942, when it was introduced in the U.S.A. An FCCU accepts chains of hydrocarbons and breaks them into smaller ones in a chemical process called cracking. This allows refineries to utilize their crude oil resources more efficiently, making more products such as petrol for which there is a high demand.

A continuous FCCU has a primary reactor, a distillation column for separating out the cracked hydrocarbons, and regeneration unit for cleaning the catalysts and preparing them for reuse.

**DESTEC PROCEDURE**

1. Bottom rail showing secure welds
2. Bottom rail with top rail mounting brackets in position
3. Rail positions and brackets in position
4. Rail positions showing non-removable obstructions
5. Top and bottom rails ready for dressing

6. ‘C’ plate brackets tacked over cut line area
7. ‘C’ plate brackets fully welded and setting machine on the rail
8. Initial cut
9. Finished prep showing refractory wall
10. Cutting the refractory

11. Grinding frame
12. Re-gen head with ‘C’ plates and wedges positioned
13. Re-gen head with ‘C’ plates and wedges fitted
14. Prep completed. ‘C’ plates and alignment plates fitted
15. Re-gen head lift

(Refractory lining of ceramic capable of resisting & maintaining high temperatures.)
